They are a true multi-protocol transceiver complying with 80km SONET OC-192 and SDH STM-64 per ITU-T G.959.1: P1L1-2D2, and also support 10GBASE-ZR/ZW 80km 10-Gigabit Ethernet, 10-Gigabit Fibre Channel 1200-SM-LL-L, and all ITU-T G.709 OTN/FEC (protocols up to 11.32Gb/s. The transceiver is also capable of supporting 8GFC, 800-SM-LC-L, with full compliance to the Tx & Rx electrical jitter specifications by adjusting a "rate select" bit through the I^{2}C interface. Digital diagnostics functions are available via a 2-wire serial interface, as specified in the XFP MSA. The transceiver is RoHS compliant and lead free per Directive 2002/95/EC[3], and Finisar Application Note AN-2038[4].

VIII.   Digital Diagnostics Functions

As defined by the XFP MSA[1], Finisar XFP transceivers provide digital diagnostic functions via a 2-wire serial interface, which allows real-time access to the following operating parameters:

- Transceiver temperature
- Laser bias current
- Transmitted optical power
- Received optical power
- Transceiver supply voltage

It also provides a sophisticated system of alarm and warning flags, which may be used to alert end-users when particular operating parameters are outside of a factory-set normal range.

The operating and diagnostics information is monitored and reported by a Digital Diagnostics Transceiver Controller (DDTC) inside the transceiver, which is accessed through the 2-wire serial interface. When the serial protocol is activated, the serial clock signal (SCL pin) is generated by the host. The positive edge clocks data into the XFP transceiver into those segments of its memory map that are not write-protected. The negative edge clocks data from the XFP transceiver. The serial data signal (SDA pin) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially. The 2-wire serial interface provides sequential or random access to the 8 bit parameters, addressed from 000h to the maximum address of the memory.

For more detailed information, including memory map definitions, please see the XFP MSA documentation[1].

### 8.5Gb/s Fibre-Channel Support:

To operate the FTLX1812M3BNL at 8.5Gb/s Fibre-Channel, the transceiver CDRs need to be placed in "8GFC" mode by changing the register value in EEPROM-Table 0, Byte 117, Bit 0.

- EEPROM Byte 117, Bit 0 value for 8GFC operation: Bit 0 = 1
- EEPROM Byte 117, Bit 0 value for standard 10G operation: Bit 0 = 0

By default, a power cycling the transceiver will return the CDRs to standard 10G operation.
